A. PENDAHULUAN

Perkembangan layanan berbasis internet mendorong banyak organisasi dan individu untuk memanfaatkan Virtual Private Server (VPS) sebagai media penyimpanan data dan penyedia layanan secara online. VPS memberikan fleksibilitas dan kemudahan dalam pengelolaan sumber daya, namun di sisi lain memiliki kelemahan pada aspek keamanan, terutama terhadap serangan yang menyasar layanan jaringan seperti Secure Shell (SSH). Kondisi ini menuntut adanya mekanisme pendekripsi serangan yang efektif agar administrator dapat mengenali pola serangan sejak dulu dan melakukan tindakan pencegahan yang tepat.

Salah satu pendekatan yang banyak digunakan untuk mempelajari dan mendekripsi serangan adalah penggunaan honeypot. Honeypot merupakan sistem jebakan yang sengaja dibuat menyerupai server asli dengan tujuan menarik perhatian penyerang, sehingga seluruh aktivitas penyerang dapat dipantau dan direkam tanpa mengganggu layanan produksi. Data log yang dihasilkan honeypot dapat dimanfaatkan untuk menganalisis teknik, pola, serta intensitas serangan yang terjadi pada sebuah server.

Pada tugas besar ini diimplementasikan honeypot Cowrie pada lingkungan VPS atau simulasi VPS berbasis Ubuntu Server sebagai pendekripsi serangan terhadap layanan SSH. Cowrie dipilih karena mampu mensimulasikan layanan SSH secara interaktif dan mencatat detail aktivitas penyerang, mulai dari upaya login hingga perintah yang dijalankan. Pengujian dilakukan dengan tiga jenis serangan, yaitu port scanning menggunakan Nmap, brute force attack menggunakan Hydra, dan denial of service (DoS/DDoS) menggunakan LOIC. Hasil pengujian kemudian dianalisis untuk melihat kemampuan honeypot dalam mendekripsi serangan serta tingkat akurasi deteksi yang dihasilkan.

Tujuan dari laporan ini adalah mendeskripsikan proses konfigurasi honeypot Cowrie pada Ubuntu Server, menjelaskan langkah pelaksanaan tiga skenario serangan terhadap layanan SSH, serta menyajikan hasil dan analisis deteksi serangan oleh honeypot. Dengan demikian, diharapkan implementasi ini dapat menjadi referensi dalam meningkatkan keamanan layanan VPS

sekaligus sebagai sarana pembelajaran mengenai perilaku dan pola serangan pada sistem jaringan.

B. KONFIGURASI LINGKUNGAN DAN HONEYPOT

1. Konfigurasi Server Asli (VPS)

Dalam pelaksanaan tugas besar ini, honeypot diimplementasikan pada sebuah server berbasis Ubuntu Server yang berperan sebagai simulasi VPS. Server dijalankan pada lingkungan virtual (*Virtual Private Server* atau mesin virtual menggunakan VirtualBox) dengan spesifikasi minimal 1 vCPU, 2 GB RAM, dan kapasitas penyimpanan 20 GB untuk menjamin stabilitas layanan sistem operasi dan aplikasi honeypot. Koneksi jaringan server dikonfigurasi menggunakan mode **Bridged Adapter** agar server mendapatkan alamat IP yang valid dan dapat diakses secara langsung oleh mesin penyerang dalam jaringan lokal yang sama.

Setelah proses instalasi Ubuntu Server selesai, dilakukan konfigurasi awal berupa pembaruan paket sistem menggunakan perintah apt update dan apt upgrade untuk memastikan sistem memiliki *patch* keamanan terbaru. Layanan SSH asli pada server diaktifkan agar administrator dapat mengelola server secara *remote*. Untuk menghindari konflik, port SSH bawaan (default) dipindahkan dari port 22 ke port lain (yaitu **port 2222**). Hal ini dilakukan agar port 22 dapat digunakan secara khusus oleh honeypot Cowrie sebagai layanan jebakan. Dengan pemisahan ini, aktivitas penyerang yang mencoba mengakses SSH pada port standar (22) akan masuk ke honeypot, sementara administrator tetap memiliki akses aman melalui port 2222.

2. Instalasi & Konfigurasi Honeypot Cowrie

Honeypot yang digunakan pada penelitian ini adalah **Cowrie**, yaitu honeypot interaktif yang mensimulasikan layanan SSH dan Telnet untuk menangkap dan mencatat aktivitas penyerang. Proses instalasi dimulai dengan membuat akun pengguna (user) khusus bernama `cowrie` yang berfungsi menjalankan layanan honeypot secara terisolasi, sehingga meminimalisir risiko terhadap akun administrator utama (root).

Selanjutnya, dilakukan instalasi berbagai dependensi yang dibutuhkan, seperti Python 3, `python3-venv`, `git`, dan pustaka pendukung kriptografi menggunakan manajer paket `apt`.

Kode sumber Cowrie diunduh dari repositori resmi GitHub dan ditempatkan pada direktori `home` pengguna `cowrie`. Di dalam direktori tersebut, dibuat lingkungan virtual Python (*virtual environment*) untuk mengelola paket dependensi Cowrie secara terpisah dari sistem global guna mencegah konflik *library*. Karena terdapat kendala pada instalasi standar, instalasi dilakukan menggunakan metode *developer mode* (`pip install -e .`) untuk memastikan *source code* terkompilasi dengan benar.

Konfigurasi dasar honeypot dilakukan dengan menyalin berkas `cowrie.cfg.dist` menjadi `cowrie.cfg` dan menyesuaikan beberapa parameter kunci. Parameter `listen_endpoints` diubah agar Cowrie berjalan pada **port 2223** (mengingat port 2222 sudah digunakan oleh SSH asli). Agar honeypot terlihat meyakinkan, ditambahkan aturan NAT (*Network Address Translation*) menggunakan `iptables` yang berfungsi membelokkan (*redirect*) trafik dari **port 22 (Pintu Utama)** ke **port 2223 (Honeypot)**.

Dengan konfigurasi ini, setiap upaya koneksi SSH ke alamat IP server pada port standar akan dialihkan secara transparan ke honeypot, dan seluruh aktivitas penyerang akan direkam pada berkas log. Layanan Cowrie kemudian dijalankan, dan administrator dapat memantau serangan secara *real-time* melalui berkas log yang tersimpan di direktori `var/log/cowrie/cowrie.log`. Konfigurasi ini memastikan sistem siap untuk tahap pengujian menggunakan tiga vektor serangan: *Port Scanning*, *Brute Force*, dan *Denial of Service (DoS)*
